

EMC support and measurements service

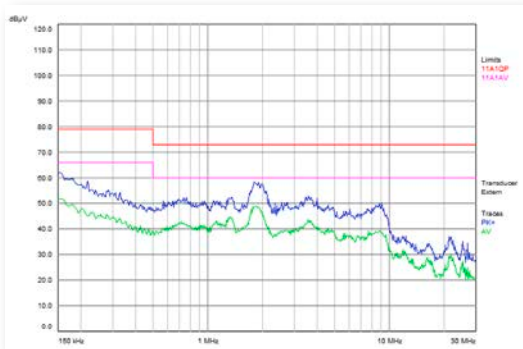

1 Machines and appliances

Every manufacturer must be able to prove that his device has a CE declaration and therefore is compliant with the EMC directive. Using EMC-compliant components does not automatically imply that the final product is EMC-compliant.

3 Non-compliance

The standards that apply to the equipment under test are clarified and verified by means of our EMC measurements service.

5 Compliance

As an option, an accredited measurement report can be provided which can be used for the documentation of the CE self-declaration. The raw data of the measurement results are available to you in any case.

2 Pre-compliance test

We help you to verify the EMC compliance on site and to evaluate the contribution of an EMC filter. On top of that, we are accredited for measurements of conducted interferences.

4 Corrective actions

Corrective actions are proposed against nonconformity, such as wiring adaption, shielding, grounding concepts, or the use of EMC filters.

6 CE

The EMC part of the EC declaration is verified and documented and therefore leaves no room for uncertainty.
